

ISSUE LOG			
<b>Project Name</b>	FitBro		
Issue #	Description	Priority	Status
1	Some of the front end designs we planned to implement such as the layouts and input boxes are proving to be a challenge to modify with bootstraps acting as the primary source of the html and css via templates. Aaron and Zana will investigate some ways to be able to better customize and change the bootstrap provided code for our needs.	Medium	Completed
2	Directly reading and writing JSON files is proving to be difficult especially with the large amounts of different data that our application will be dealing with. Yuval will investigate more methods to simplify the code necessary. Will also investigate the possible implementation of MongoDB that was introduced in the lab as that may be more beneficial and would make the reading and writing of JSON files unnecessary. Priority high as this necessary to complete the project and decision made by next week is necessary as lots of time will be necessary to implement either solution.	High	Starting
